

MESSENGER McHort

McPHERSON HORTICULTURE

Every year brings different weather, but whatever the weather there will always be plant pests and diseases to manage. Timing is critical! We know that many of you would really prefer to use as few chemical pesticides and fungicides as possible, so we have re-educated ourselves and learnt about how to suppress nursery pests and diseases using biologicals. Sadly, not all biological alternatives work well under typical, intensive, nursery cultural practices. The good news, however, is we have already researched & trialed for you. We know what works and, more importantly, what doesn't! Plenty of products make extravagant claims. In our experience, very few deliver on these. You still might have to use chemicals under some circumstances, but let's at least use these proven products and methods when we can for the sake of the children and the environment. It's not just about products, however. You'll need some specific cultural techniques too. Call us; we have the 'Know how'.

Cheers and good growing.

PLANT SOAP Prevents fungal attack

The bottom half of this flax leaf has been sprayed with McHort Plant Soap. Irrigation or rainfall rolls off instantly leaving a dry surface that is inhospitable to fungal colonisation. Simple, but very effective. One of the triple benefits of Plant Soap use.

PLANT SOAP from McHort

FOR PEST SUPPRESSION – Simply suffocates a wide range of biting & sucking insects right there on your plants. Aphid, Whitefly, mites, scale, Mealy bug and many more. Adults, juveniles and eggs. Non toxic, gentle on pollinators and pest predators. Safe for you, your staff and your customers.

ENHANCES BIOLOGICAL DISEASE SUPPRESSION.

Plant Soap is a plant derived protein which is a viable food source that helps the biological fungicide *Trichoderma viridis* establish on your plants. A combination spray of McHort Plant Soap and TrichoSpray Nursery will form a living barrier on your plants that will challenge fungal pathogens through niche exclusion.

DE-WATERING – Plant Soap is a natural surfactant which, when sprayed onto the leaves & stems, prevents water from settling. This persistent effect denies wind blown or water borne fungal spores the conditions they need to germinate and attack your plants. Cool, aye!
